

CANNABINOID CONCENTRATE HANDLING INSTRUCTIONS

# BROAD SPECTRUM DISTILLATE

**Your product will be labeled with the following information:**

Description of the product, mass of product, tare weight (TWL) of the container including the lid or cap, batch number (referenced by a Certificate of Analysis - COA)

**Broad Spectrum Distillate** is a highly-purified, clear, concentrated cannabinoid blend, its high CBD content can cause it to crystallize and convert to solid form over time. The higher the CBD content, the more rapidly it will crystalize. The crystallization process causes a separation to occur, crystals are enriched in CBD content, while the surrounding oil will become depleted.

**To ensure the accuracy of formulations and analytic tests, please observe the following guidelines:**

Verify the amount of material received by weighing the entire container, including the lid and subtracting the tare weight on the label.

Crystallization causes Broad Spectrum Distillate to become non-homogeneous, thus distillate should be melted and thoroughly mixed prior to sampling.

Use gentle heat only to liquify distillate. Heating in excess of 80° C (176° F) is unnecessary and may result in degradation of the material. A water bath or low-temp electric oven are both excellent ways of quickly heating distillate, at a moderate temperature.

Once no more solid particles remain, stir the distillate thoroughly.

Cannabinoids (especially CBD) are adversely affected by light, oxygen, and moisture. Do not keep the distillate warm for a prolonged period of time. Keep material sealed in a cool dark place when not in use.
